# Operaciones de red y seguridad centrada en la aplicación

The screenshot displays the VMware NSX Manager interface, which is application-centric. On the left, the 'Saved Applications' section shows a list of 78 applications, including frontend, infrastructure, and various business applications like CRM and 3TierApp02. A network topology diagram on the left shows an 'Internet' cloud connected to a large number of application nodes. The main area on the right is titled 'Network Topology' and shows a detailed view of the network, including AWS Cloud, Google Cloud, Internet, NY, Dallas, PR-DC, and Backbone components. A central panel displays 28 events, categorized by type. The events include 'Console Access Pass...' (6 events) and 'Reachability' (2 events). The events are sorted by type and show details such as the event type, duration, and time.

**Events (28)**

# Descubrimiento de Aplicaciones

## Applications, Flows, Policy & Network

### Discover Apps

- Naming Convention, Tags, CMDB, Security Tags, Security Groups, or auto discovery by ML on flows.

### Curate/Approve

- Add physical end points
- Save → Auto-Baseline

### Operate

- Security: Traffic Analysis, Planning, Audit
- Troubleshooting: App and Topology
- Analytics: Top Flows, Latencies, Anomalies

The screenshot displays the VMware NSX Discover Applications interface. At the top, there are tabs for 'Saved Applications' and 'Discovered Applications'. Below these are filter tabs: 'Tags', 'Name', 'Service Now', and 'Custom'. A search bar contains the text: 'Look for all VMs where Applications are defined by Name matching expression (\*):\*:\*: and Tiers are defined by Name matching expression \*::(\*):\*:'. A 'Modify' button is to the right.

The main area is split into two panels. The left panel shows a network topology map with a grid of hexagonal nodes. A central node is highlighted in blue, and several green lines radiate from it to other nodes, representing network connections.

The right panel shows a search bar with the text 'Search for Applications'. Below it, it says '232 Applications Found | 402 Unclassified VMs'. A table lists the discovered applications with the following columns: Application Name, Protected Flows, Dropped Flows, # of Tiers, and # of Members.

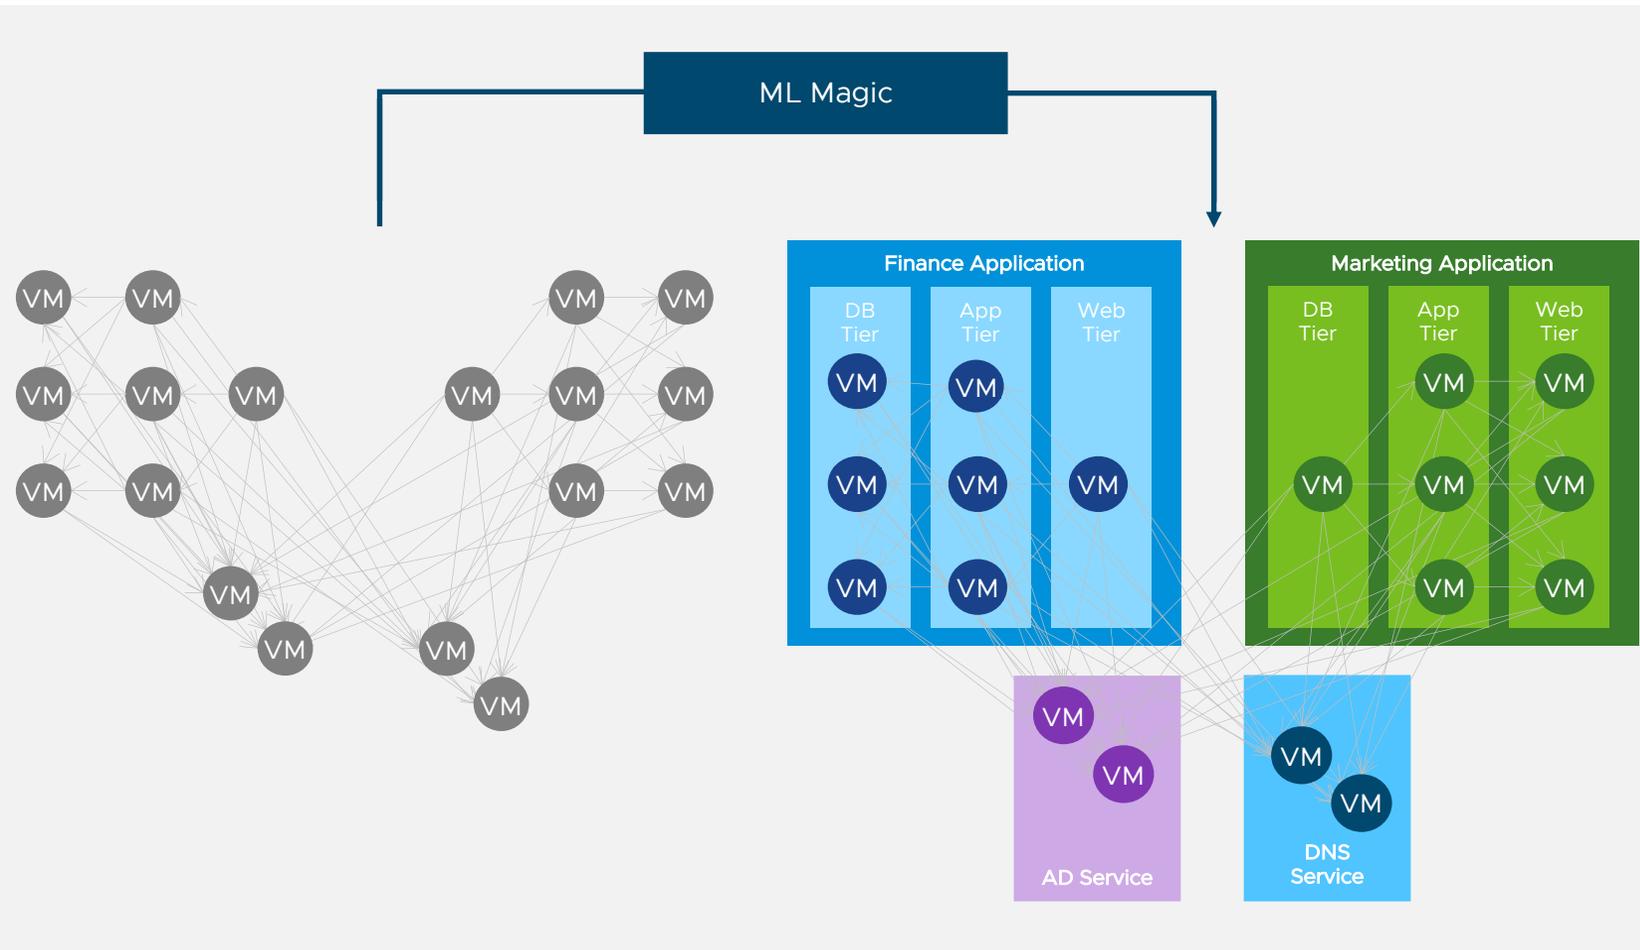

Application Name	Protected Flows	Dropped Flows	# of Tiers	# of Members
App-1415	0	3	2	8
App-40	0	363	2	8
App-120	0	23	2	8
App-24	0	214	3	8
App-104	0	390	3	8
App-119	0	32	2	7
App-114	0	104	3	7
App-61	0	30	3	7
App-66	0	8	3	7
App-137	0	14	2	7
App-161	0	0	2	7
App-131	0	95	3	7
App-25	0	115	2	7

Below the table, there is a detailed view for 'App-131'. It shows a 'Tier' table with columns 'Tier', 'Me...', and 'Definition'.

Tier	Me...	Definition
be	2	(name) and ((name matches '{App-131}:::*') and (n;
web	2	(name) and ((name matches '{App-131}:::*') and (n;
db	3	(name) and ((name matches '{App-131}:::*') and (n;

# Descubrimiento basado en flujos

## Using Machine Learning on Traffic Patterns

### Outcomes

- Automatically discover application boundaries without any input.
- Keep application definitions up to date when new VMs are added.

### Benefits

- Discover all applications in hours, not days/weeks.
- Complete your CMDB with actual application behavior.
- Reliable application groupings based on network traffic.

# Micro-segmentación basada en aplicaciones

## NSX

1

Assess current environment

FREE Virtual Network Assessment Available!

2

Deploy NSX Data Center

NO changes to your current physical network!

3

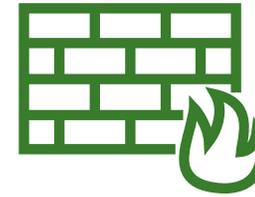

Identify Application Boundaries

Discover services, applications and their boundaries!

4

Get Recommended Firewall Rules

NSX Firewall IPS/IDS helps provide application level rules!

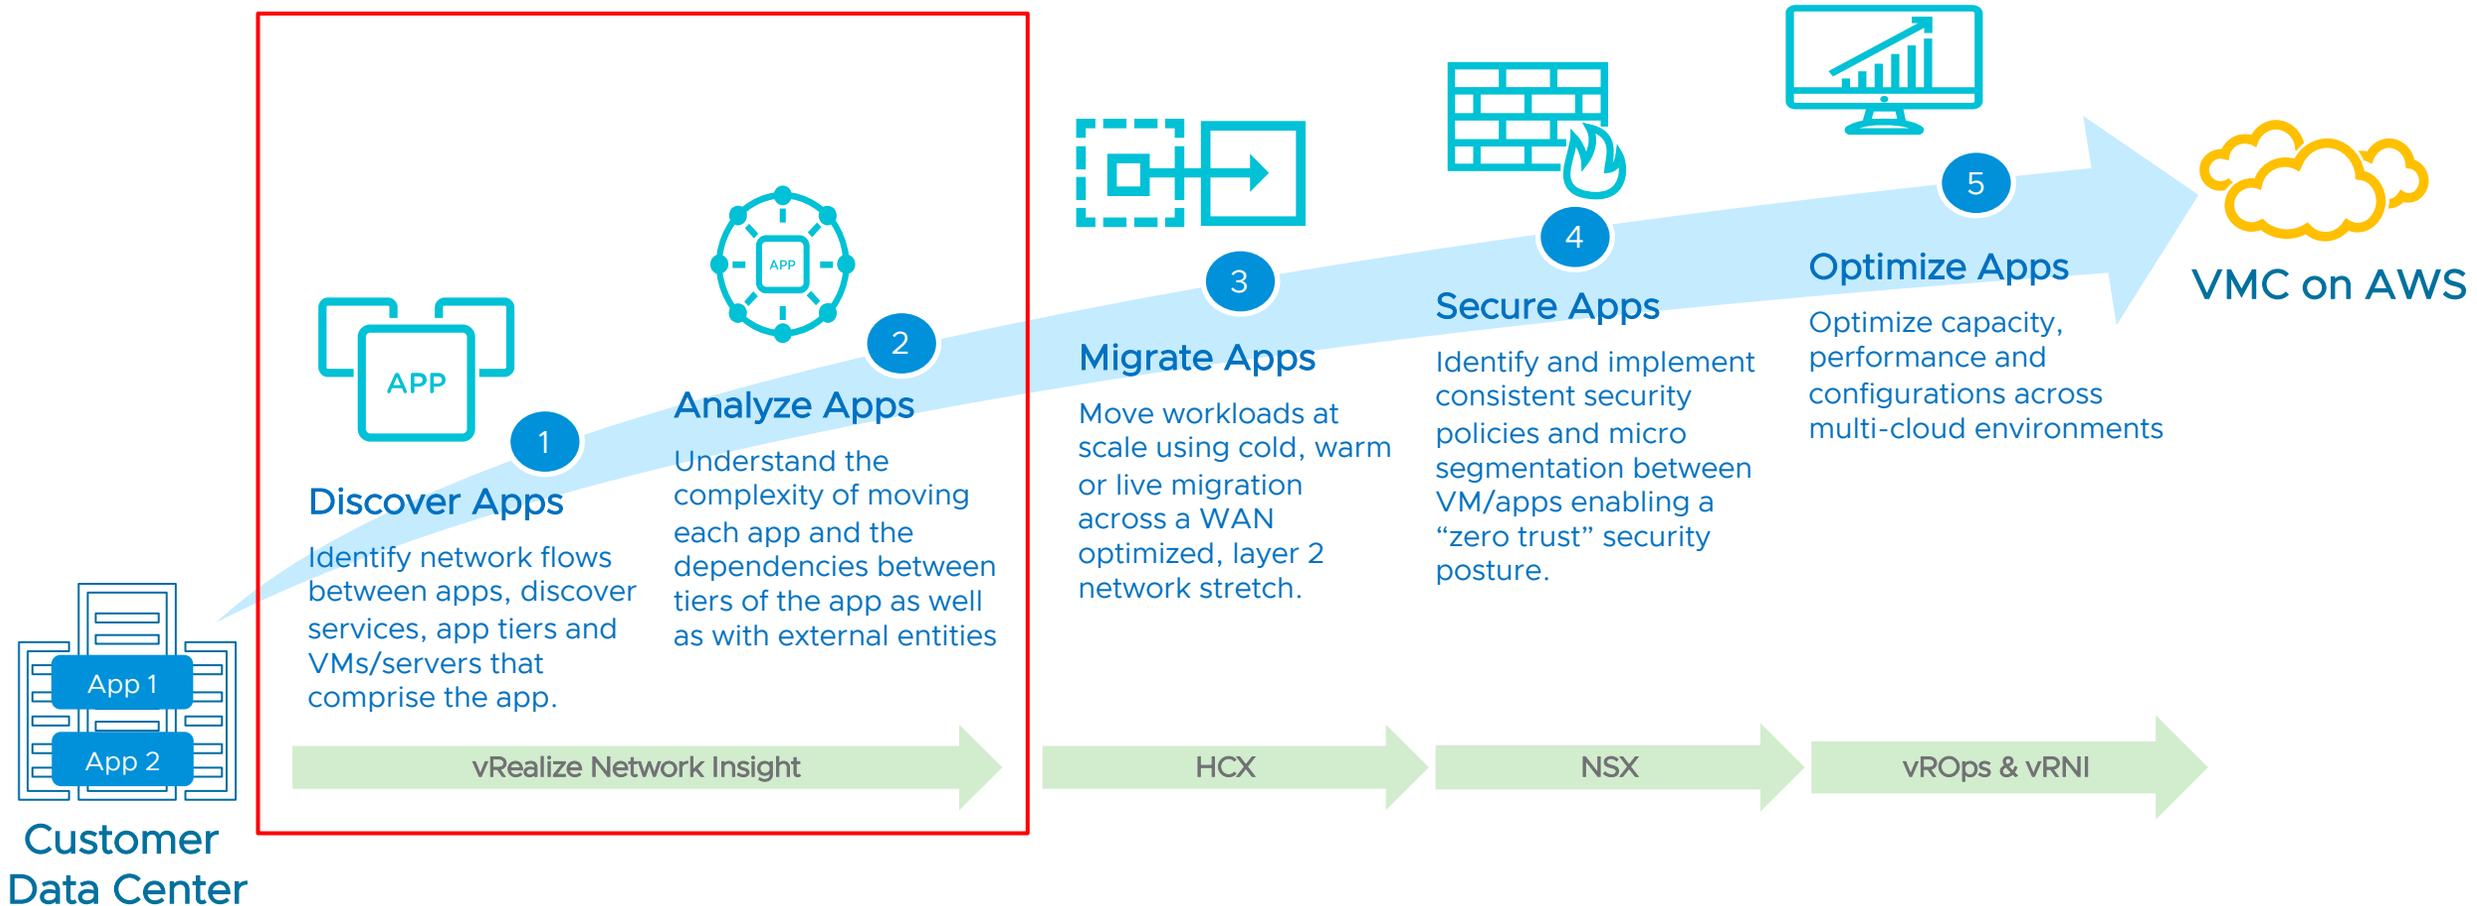

5

Repeat, Monitor, Troubleshoot

Deploy micro-segmentation starting with most critical apps first!

# Cumplimiento

PCI sections covered - This dashboard provides data to help assess compliance against below PCI requirements in a VMware NSX environment [i](#)

- 1 Section 1.1.1 - A formal process for approving and testing all network connections and changes to the firewall and router configurations.
- 2 Section 1.1.2 - Network diagram that identifies all connections between the data environment and other networks.
- 3 Section 1.1.3 - Network diagram that shows all data flows across systems and networks.
- 4 Section 1.1.4 - Requirements for a firewall at each Internet connection and between any demilitarized zone (DMZ) and the internal network zone.
- 5 Section 1.3.1 - Implement a DMZ to limit inbound traffic to only system components that provide authorized publicly accessible services, protocols, and ports.
- 6 Section 2.3 - Encrypt all non-console administrative access using strong cryptography.
- 7 Section 6.4 - Follow change control processes and procedures for all changes to system components.

# Integración con vRealize Operations

The screenshot displays the vRealize Operations Manager interface. The top navigation bar includes 'vm vRealize Operations Manager', 'Home', 'Dashboards', 'Alerts', 'Environment', and 'Administration'. The main content area is titled 'ESG-02-Load' and shows a 'Summary' tab. A 'Recommended Actions' section features a donut chart with '1 Objects' and a legend for alert severity: Critical (0), Immediate (1), Warning (0), Normal (0), and Unknown (0). Below this is a table of alerts:

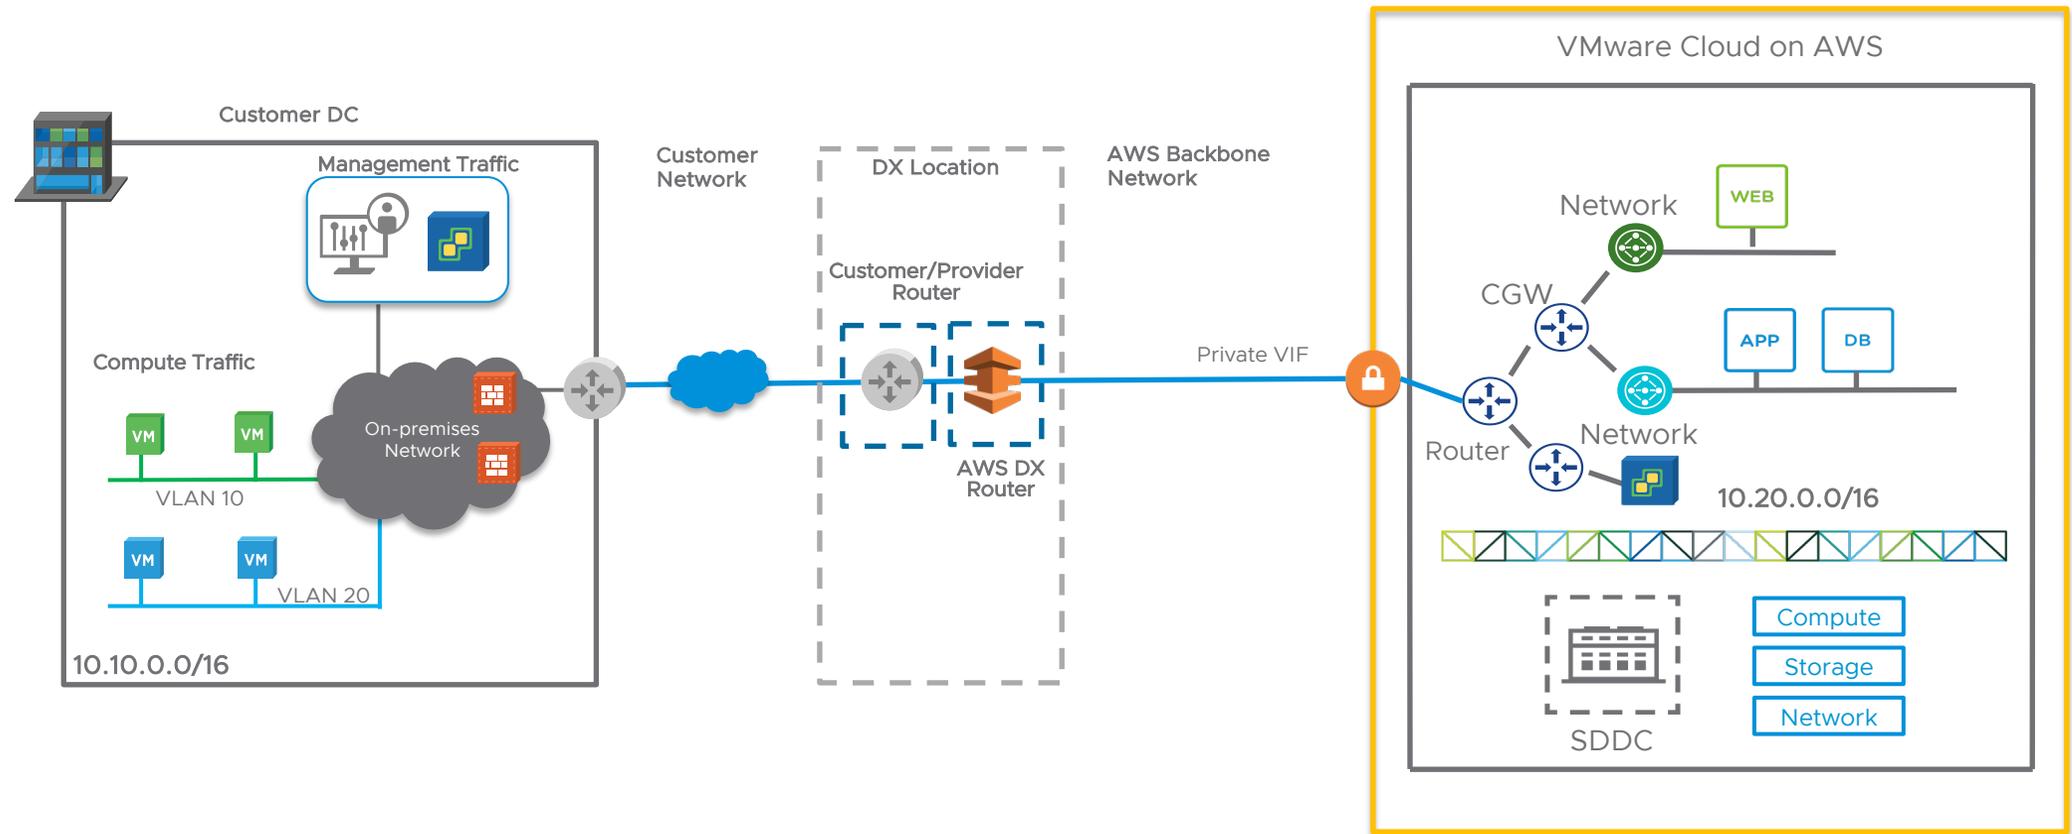

Name	Alert	Alert Type	Alert...	Time	Suggested Fix	Action
ESG-02-Load	High Availability is not enabled on the Edge	Network Alerts	Co...	3/25/...	Enable High Availability o...	
ESG-02-Load	vRNI-OSPF is enabled on the NSX Edge, but Interface to OSPF area mapping configuration is missing	Network Alerts	Co...	3/25/...	Configure the OSPF to int...	
ESG-02-Load	vRNI-High Availability is not enabled on the	Network Alerts	Co...	3/25/...	Enable high availability ...	

The right sidebar shows the object details for 'ESG-02-Load' (Object Type: NSX-vSphere Edge) with resource usage metrics: CPU|Provisioned: null, CPU|Used: 98.2 MHz, Disk|Provisioned: null, Disk|Used: null, Memory|Provisioned: null, Memory|Used: null.

## VMware Virtual Network Assessment Service

Powered By VMware vRealize Network Insight Cloud

### What is VMware Virtual Network Assessment Service?

Take the VMware Virtual Network Assessment Service, for free insight into the security and network posture of your data center. Using this service, you can generate a report that will allow you to:

- **Quantify the security vulnerability in your environment by showing the East-West traffic percentage:** This is the percentage of traffic in your data center that's not protected by the perimeter firewall. Traditional approaches to securing a data center focus on strengthening the perimeter to protect from incoming threats – However in this instance, when the perimeter firewall is breached, hackers can magnify the scale of attack by compromising multiple hosts within the data center.
- **Quantify the scope for optimizing your data center network infrastructure:** The assessment gives you detailed percentages of traffic – whether it's switched, routed, going out to the Internet, within a host, or VM to VM. This information helps you to build an optimized network where frequently communicating VMs can be located together on the same Layer 2 network, or even the same host.
- **Identify anomalous behavior, top talkers and application communication patterns in your data center traffic:** Using this functionality, customers have reported detecting anomalous behavior such as hosts that were compromised for mining Bitcoins, anomalous traffic going out to unspecified countries, and others.

### VMware SD-WAN Assessment Service

Powered By VMware vRealize Network Insight Cloud

### What is VMware pre-SD-WAN Assessment Service?

Take the VMware pre-SD-WAN Assessment Service for insight into the benefits of running VMware SD-WAN™ solution by VeloCloud®. Using this service, a report will be generated that will justify migrating your traditional branch to an SD-WAN branch.

The VMware pre-SD-WAN Assessment will analyze configuration, metrics, and the flow patterns of the various branch offices and data center sites to estimate the cost savings that VMware SD-WAN™ by VeloCloud® can bring over their existing traditional WAN setup. The following insights present possible OPEX and CAPEX savings.

The assessment will give a breakeven time for the investment in SD-WAN based on your current branch WAN costs using data from 1 to 20 routers for the assessment and then extrapolating the calculation across all their branches.

The savings will automatically be calculated by incorporating an analysis based on WAN uplink costs, optimization and reduction of MPLS monthly costs, device savings with Dell routers, internet traffic rates, bandwidth utilization, packet drops, and application service analysis.

Benefits of taking the VMware SD-WAN Assessment Service:
