Installing PowerCLI

Installation of PowerCLI is from the PowerShell Gallery and is done directly from within PowerShell

Windows Prerequisites:

- PowerShell 5.x (OR manually install PowerShellGet)
- Uninstall PowerCLI 6.5 RT (OR any other previous versions)
- Internet Connectivity

MacOS/Linux Prerequisites:

- PowerShell Core 6.0.1+
- Internet Connectivity

Installation:

- Open a PowerShell Session
- Run: `Install-Module VMware.PowerCLI -Scope CurrentUser`

Connect to vCenter Server or ESXi

To connect to a VMware vCenter server or ESXi Host: Start a new PowerShell Session

```
$srv = Connect-VIServer -Server "vcenter.fqdn" -User Admin -Password Pass01
```

To disconnect from the connected vSphere server:

```
Disconnect-VIServer -Server $srv -Confirm:$false
```

Getting Started Samples

To list all the snapshots for all virtual machines:

```
Get-VM | Get-Snapshot
```

Top 5 VM memory allocation:

```
Get-VM | Sort-Object -Property MemoryGB -Descending | Select -First 5
```

Total memory available on all ESXi:

```
$vs = Get-VirtualSwitch -VMHost "vmhost.fqdn" -Name "Switch01"
Get-VirtualPortGroup -VirtualSwitch $vs
```

To list all of the disks within a VSAN disk group for an ESXi host:

```
$vsanDiskGroup = Get-VsanDiskGroup -VMHost "vmhost.fqdn"
Get-VsanDisk -VsanDiskGroup $vsanDiskGroup
```

Remotely Invoke Commands:

```
Invoke-VMScript -VM "LABTEST1" -ScriptText "dir" -GU Administrator -GP "VMware!"
```

Community Repository

The VMware PowerCLI Community Repository is a central location where anyone can contribute their own resources. The repository features a Principles of Operations document to help guide contributors along the process of using, creating, and updating resources which are contained within the repository.
