VMware vCloud Suite
Your IT Infrastructure upgraded to a Software-Defined Data Center

vCloud Operations Management

vCenter Operations Management
Performance and capacity optimization – analytics, dashboards and alerting

- Increase simplicity of service operations and improve compliance for your dynamic hybrid cloud infrastructure and business-critical applications with VMware vCenter Operations Management. vCenter Operations Management scanning provides you with detailed application blueprints, which are essential to your underlying infrastructure. Any application can be remediated or deployed based on any automation.

- Simple application blueprints are rendered using our own components.

- Application blueprints are formed for each application.

- Virtualization and automation of critical applications.

- Improved configuration management and productivity.

- Improved cost analysis and profitability.

- Increase service availability, reliability and performance.

- Automation and remediation of service failures.

- Integration with VMware vCloud Director software-defined services.

vCenter Infrastructure Navigator
Application Awareness – discovery and configuration mapping

- VMware vCenter Infrastructure Navigator enables application-aware management of both virtual and physical infrastructure.

- Finds applications linked to physical resources.

- Helps to locate issues in vCOPS.

- Provides automated discovery and mapping.

- Enables application-aware management of both physical and virtual resources.

- Increases operational efficiency by automatically mapping applications to physical resources.

-Decrease time to service restoration by correlating configuration changes with performance
